Abstract: Many scholars now argue for deemphasizing the importance of international anarchy in favor of focusing on hierarchy—patterns of super- and subordination—in world politics. We argue that only one kind of vertical stratification, governance hierarchy, actually challenges the states-under-anarchy framework. But the existence of such hierarchies overturn a number of standard ways of studying world politics. In order to theorize, and identify, variation in governance structures in world politics, we advocate a relational approach that focuses on three dimensions of hierarchy: the heterogeneity of contracting, the degree of autonomy enjoyed by central authorities, and the balance of investiture between segments and the center. This generates eight ideal-typical forms: national-states and empires, as well as symmetric and asymmetric variants of federations, confederations, and conciliar systems. We argue that political formations—governance assemblages—with elements of these ideal types are likely ubiquitous at multiple scales of world politics, including within, across, and among sovereign states. Our framework suggests that world politics is marked by a heterarchy of nested and overlapping political structures. We discuss broad implications for international-relations theory and comparative politics, and illustrate our approach through an analysis of contemporary China and the evolution of the British “Empire” in the 19th and 20th centuries.

Acknowledgments: We thank the editors at *International Theory*, Maia Gemmill, Kathleen McNamara, Abraham Newman, the participants in the International Relations Speaker Series at the University of Texas, Austin, the numerous Georgetown graduate students Nexon subjected to this typology in his seminars, and especially our three anonymous referees for insightful comments and suggestions. We apologize to those that we have inadvertently omitted from this list. This article was funded by the Norwegian Research Council under the project “Undermining Hegemony,” project no. 240647.

A growing number of scholars call for downgrading the centrality of international anarchy in international-relations theorizing in favor of a focus on hierarchy (Mattern and Zarakol 2016; Hobson 2014; Hobson and Sharman 2005; Lake 2009). But what does this actually mean for international-relations theory? “Hierarchy” refers to any pattern of super- and subordination. The field routinely places states’ rankings by status, economic roles, and military capabilities at the center of its scholarship (e.g. Towns 2009; Paul, Larson and Wohlforth 2014). Such dimensions of international hierarchy pose no special problems for thinking of world politics as anarchical.

However, one dimension of hierarchy among and across political communities, that involving *governance*, challenges the states-under-anarchy framework. We think that such governance hierarchies are likely ubiquitous features of world politics. We contend that the common practice of deriving the presence of anarchical relations from conditions such as the existence of independent diplomatic relations among actors, the *de jure* or *de facto* presence of a right to exit formal and informal governance hierarchies, or the observation of power-political behavior rests on deeply problematic assumptions about how governance arrangements operate. *Some* relations among *some* actors likely *do* take on anarchical forms, but we think that much of the action in world politics occurs under conditions that Donnelly (2009: 64) terms heterarchic: involving “multiple, and thus often ‘tangled’... hierarchies.”

How then can we incorporate variation in hierarchical, as well as anarchical, governance arrangements into international-relations theory? We argue for an explicitly relational account of governance—or political—structures (see Goddard 2009; Jackson and Nexon 2009; and McCourt 2016). Patterns of governance relations assemble to create overlapping and nesting political formations. These operate within, across, and among sovereign states (Mansbach and Ferguson 1996, 48-9). Moreover, we can parse these in terms of a limited number of ideal-typical forms: national-states and empires, as well as asymmetric and symmetric variants of federations, confederations, and conciliar systems. Real-world governance assemblages—both formal or informal and including those that characterize sovereign states—combine features of these ideal types.¹

This shift helps rectify a deep bias in international-relations and comparative-politics scholarship that helps perpetuate the states-under-anarchy framework. International-relations scholars tend to follow the lead of comparativists when it comes to, for example, classifying federal and confederal arrangements. Almost all of the cases of federations and confederations that comparativists study, however, are sovereign states. Because the empirical examples used to construct definitions of these forms display not insignificant centralization and enjoy relatively expansive governance authority, the result is a “national-state” bias against the detection of governance hierarchy in more decentralized political communities where central organs—if they even exist—enjoy fairly limited governance authority. In international-relations scholarship, such governance structures often become

¹ Throughout this manuscript, we use the term “formal” in two different ways, as opposed to “informal” and in terms of the abstract properties of governance hierarchies. The latter usage contrasts “form” with “content”—the specific meanings and character of relations. As much as possible, we try to reserve “formal” for the first usage and “form” for the second.

misidentified as ‘anarchical bargains.’ In comparative politics, they often drop out of the field of view entirely.

Because comparative scholars usually exclude international organizations—such as the United Nations (UN), the North Atlantic Treaty Organization (NATO), and the International Monetary Fund (IMF)—from the comparative universe of political communities, both they and international-relations scholars neglect the degree to which federal, confederal, and conciliar arrangements characterize such organizations and structure relations within them. Put differently, the typological problems that European Union (EU) scholars confront on a routine basis are actually the leading edge of a better understanding world politics (see McNamara 2015). Wedged uncomfortably between a conventional federation and an international organization, the EU appears, as Pufendorf described the German Empire when compared to kingdoms of the seventeenth century, as an “irregular body... like a misshapen monster” (Kalmo and Skinner 2010, 19). This misshapeness, though, derives from rigidity in existing theory.

Finally, these biases help compress—at least in the study of international relations—the tremendous variation found in the political forms of sovereign states. The states-under-anarchy framework does not prevent opening up the ‘black box’ of the state, but it focuses attention on a rather limited range of variation, usually related to varieties of democracy and authoritarianism. Thus, international-relations scholarship downplays the ramifications for world politics of, for example, the federative characteristics of the United States or the imperial characteristics of the People’s Republic of China (PRC). International-relations scholarship also has little to say about massive changes to political communities like the British empire, whose transformations from the mid-nineteenth until the mid-twentieth century birthed literally dozens of currently sovereign states. It seems odd to proceed as if Canada and Belize only emerged as subjects of “international relations” scholarship once they received juridical sovereignty. Their domestic institutions looked almost exactly the same immediately before and after their independence; their relations with London increasingly resembled “foreign policy” long before that time. But the states-under-anarchy framework logically entails that there must have been a phase shift—from not-state to state—far beyond that which we find in practice. To remedy these problems, students of world politics need a conceptual toolkit that can accommodate a wider range of relations than “hierarchy” and “anarchy.”

The rest of this article proceeds as follows. We overview hierarchy-centric scholarship. We elaborate the major pitfalls of that literature: first, the tendency to lump together different types of hierarchy in ways that obscure how “hierarchy” relates to the states-under-anarchy framework; second, the incomplete shift from identifying hierarchy—and governance hierarchy in particular—to studying variations among kinds of hierarchies; and, third, a related emphasis on the *content* of hierarchy at the expense of variation in formal analysis of its structure in terms of relation and position.

Next, we use the example of international-relations scholarship on empires to illuminate these problems. Scholars studying empires have most forcefully pushed in the direction that we call for.

These insights form the basis for, in subsequent sections, the development of our typology of hierarchical forms. We build out our typology, its assumptions, and some of its implications. We illustrate these through a discussion of embedded imperial governance structures in the People's Republic of China (PRC) and the evolution of British transnational governance. We then offer some concluding remarks.

The New Hierarchy Studies

Many international-relations scholars accept the assumption that anarchy distinguishes their field of study from other branches of political inquiry. This finds expression in Waltz's (1979, 88) formulation that the "parts of domestic political systems stand in relations of super- and subordination. Some are entitled to command; others are required to obey. Domestic systems are centralized and hierarchic." In contrast, "the parts of international-political systems stand in relations of coordination. Formally, each is the equal of all the others. None is entitled to command; none is required to obey. International relations are decentralized and anarchic."

Many scholars criticize this formulation. It conflates distinct concepts of centralization and governance. It defines anarchy with reference to relations of authority despite also claiming that authority hardly matters to international processes. It downplays how most international systems, both past and present, involve ordered arrangements dominated by powerful actors—such as spheres of influence, informal empires, and patron-client relations (see Sylvan and Majeski 2009; Wendt and Friedheim 1995; Krasner 1999). And it wrongly implies that "hierarchy" and "anarchy" are opposites when the concepts occupy different dimensions. The opposite of hierarchy is equality; the opposite of anarchy is governance. As Barder (2016) writes, theorizing on that erroneous basis precludes "the possibility of multiple hierarchical social arrangements embedded within global anarchy."

Renewed attention to the limits of an anarchy-centered approach has produced a new wave of scholarship to insist that *hierarchy* matters in world politics. This new hierarchy studies is marked by intellectual and substantive diversity. For some, hierarchy supplies the organizing principle of international-relations scholarship (Hobson 2014). Others contend that anarchy remains a centrally important concept, but that we neglect significant 'zones of hierarchy'—how various dimensions of hierarchical stratification profoundly shape world politics.

It is challenging, to say the least, to weave a common research program from strands including standards of civilization, asymmetries in military and economic capabilities, compliance with international norms, regulatory arrangements, international institutions, and forms of interstate control. Some attempt to map the approaches of the new hierarchy studies. Mattern and Zarakol (2016, 624), for instance, divide the field into approaches that stress a "logic of tradeoffs" and those that advance "logics of productivity." However such efforts to understand the new terrain play out,

we see two problematic tendencies in this scholarship: first, an emphasis on diagnosing the *existence* of hierarchy and, second, focusing on variation in its *content* rather than its form.

Studying the brute fact of hierarchical control produces important insights, such as McDonald's (2015) finding that the democratic peace is likely an artifact of great-power sphere of influence (see also Barkawi and Laffey 2002).² We also in no way dismiss the importance of, for example, studying hierarchy in terms of how cultural content stratifies world politics, or how actors navigate such stratifications (see Towns 2009). But, as Donnelly argues (2015, 419-420), "hierarchy provides almost as poor an account of the structure of international (and national) systems as anarchy. It simply states that the pattern of stratification is not flat." Replacing anarchy with hierarchy tells us little about "*how* a system is stratified—or anything else about the (many and varied) ways in which international systems are structured."

Varieties of Vertical Stratification

Within the new hierarchy studies, we find roughly five major categories of stratification relevant to world politics: *socio-cultural hierarchy*, defined by markers of status, prestige, and symbolic priority; *class hierarchy*, defined by positions in international systems of economic exchange and production; *military-capabilities hierarchy*, defined by latent and realized military capabilities; *economic-capabilities hierarchy*, often defined by aggregate share of global economic output or the size of markets (Drezner 2014, chapter 5); and, finally, *governance (or political) hierarchy*, defined by patterns of political super- and subordination among social sites.

Much of the action in the empirical study of hierarchy focuses on relations among different patterns of super- and subordination in world politics. For instance, some claim that discrepancies between status (socio-cultural) and capabilities (military and economic) hierarchies incline states toward revisionism or finding alternative ways to enhance their status (see Ward 2017). Others seek to understand how an actor's position in one kind of hierarchy influences its position in another. For example, socio-cultural hierarchies imply patterns of social dominance, which can beget political control and hence governance relationships. In contexts where status derives from possessing superior military capabilities or enjoying a large economy, military-capabilities and economic-capabilities hierarchies also manifest in socio-cultural terms. Hegemonic-order theories take for granted that both kinds of hierarchy may translate into governance hierarchies (Musgrave and Nexon 2018; Nexon and Neumann 2018).³

Yet of these types, only governance hierarchy contravenes theories centered on international anarchy.⁴ Governance hierarchies imply the presence of common authority, however strained, attenuated,

² Barkawi and Laffey (2002), however, see the zone of the democratic peace as distinctly imperial.

³ See discussions of symbolic capital in field theory in Adler-Nissen 2014; Go 2008. For another application, see Goddard and Nexon 2016.

⁴ Compare Donnelly (2009, 52).

jointly produced, or ultimately reliant on asymmetric coercive capability. It may manifest as *de jure* (formal) or *de facto* (informal) rule of one political community over another. Relevant actors may include states, international institutions, multinational corporations, or any other relatively bounded social site.⁵

Some accounts of hierarchy stress this point. Lake's (1999) relational-contracting approach develops a typology of dyadic security relationships. It ranges from anarchical alliances, in which the two parties retain all residual rights, to empires, in which one party gives up all residual rights to the other. Lake (2009) provides a theory of hierarchy as a more generalized social contract in which states accept the authority of a powerful actor so long as its leadership remains preferable to a return to anarchy. He measures the degree of hierarchy using multiple indicators, such as independent alliances and trade dependency, that also combine into unidimensional accounts of 'more' and 'less' hierarchy.

Lake misses important facets of governance hierarchy. Reducing variation in governance hierarchy to a unidimensional account of "degree of control" may seem plausible if we remain wedded to a states-under-anarchy that assumes bright lines dividing "domestic" from "international" politics. But there is no reason, on Lake's own terms, to exclude hierarchical relations *within* states from this study. If that is the case, those bright lines should be erased. And if we think that relations vary on other dimensions besides the degree of control, then we need to specify these dimensions and their implications (see Cooley 2005).

Relationalism and Governance Hierarchy

To understand formal variation in the structure of governance hierarchies that appear at varying scales, we adopt a relationalist approach focusing on structural assemblages. Relationalism provides a productive way of theorizing international political structures (Goddard 2009; Pratt 2016; Jackson and Nexon 1999). The kind of relational theory we deploy takes the transactions that constitute both agents and structures as the fundamental unit of analysis. Classic approaches define structures as "relative stabilities in patterns of interaction." Some scholars parse these in terms of practices and fields, others in terms of processes and figurations (McCourt 2016). These relative stabilities create opportunities and constraints for actors; they also play a role in constituting actors themselves (Goddard and Nexon 2005, 36).

In this framework, anarchy obtains when a relation "between two actors" or social sites is characterized by the "absence of relevant authoritative ties, either between one another or with a third social site" (Nexon 2009, 52-55, 14). Anarchical relations may emerge at any scale and in any space of

⁵ This may represent an actor-centric understanding of governance hierarchy that excludes governance rooted in diffuse, decentered, and productive power—factors associated with, for example, post-structural conceptions of governance as knowledge regimes (Sending and Neumann 2006; Guzzini 2013; Barnett and Duvall 2005). We set aside this issue for now. If we hold the conception of governance hierarchy as involving political control by at least one social site over at least one other social site, then these conceptions of governance would help *produce or generate* various forms of political hierarchy.

political life. But so also may other political formations, including hierarchical ones. If hierarchical relations may attain at scales often described as “international,” while anarchy may equally emerge at scales considered “domestic,” then international-relations scholarship needs to exercise caution about treating anarchy as a boundary marker between them. It also means constructing theories of world politics that incorporate hierarchical arrangements.

We borrow from Tilly’s (1998, 2003) “relational realism.” Transactions create *social ties* between one or more *social sites*, such as individuals, corporate actors, or even social spaces. Social ties may prove fleeting or durable, but their patterns resolve into relative stabilities in patterns of interaction which appear as structures taking the form of networks of ties. Consequently, we can define those structures, including political formations, in terms of their network properties (Nexon and Wright 2007; Nexon 2009).

A relational approach calls attention to how political formations of various kinds may embed within, and even co-constitute, one another. We might identify a particular political formation—a social site at one level of aggregation—as having imperial network characteristics, but also find that its constituent social sites have, say, federative or national-state network characteristics. The boundaries of networks arise when “only a limited number of actors enjoy the right to form specific kinds of exchange relationships with actors outside of the network—to act as brokers between sites within one network and sites outside of it.” When only a few sites “within each network ‘has the right to establish cross-boundary relations that bind members of internal ties,’ then each network constitutes a discrete” unit. Once boundaries are established, “every member of the network is distinguished from every other actor outside of it by virtue of a particular marker—a categorical identity,” such as being the subject of an empire or the citizen of a national-state (Nexon 2009, 45-46).

Importantly, boundaries—and social sites—may exist even if the sphere of authority remains limited. For instance, NATO only polices security relations among its members that are designated by its membership as alliance issues. Thus, Turkey recently exercised its veto to block NATO cooperation with Austria. That still leaves Germany and the United States free to engage in bilateral security relationships with Austria, but not as NATO cooperation.⁶

Our approach stresses the analytical distinction between “form” and “content.” Simmel (1971, 25) argues that, “In any given social phenomenon, content and societal form constitute one reality.” As Erikson (2013, 226) notes, “Forms can be, on the one hand, types of associations (e.g., competition, domination, and subordination) or, on the other hand, geometric abstractions like the dyad or triad”. While these different uses point to analytic tensions, they both wager that we can abstract from the specific content of relations—the meanings associated with them—to more general patterns. These patterns recur across time and space. The way that they position actors, and their overall forms, provides a basis for identifying similarities and differences in structural arrangements. They also allow

⁶ “Nato hit by Turkish veto on Austria partnership” *BBC News*. Available at <http://www.bbc.com/news/world-europe-40013507>. Accessed 23 May 2017.

for the theoretical elaboration of dynamics that follow from these similarities and differences (see Nexon 2009, 64-5).

We agree with many relationalists that the analysis of the abstract properties of social relations provides only incomplete explanations of causal processes and outcomes, and that the “duality of tie and content” often needs to be relaxed, if not overcome, in specific empirical analysis (Erikson 2013, 228). At the very least, content generates the very properties of the relations that provide the basis for formal abstraction. Nonetheless, the distinction matters a great deal for theorizing governance hierarchies and for identifying structural variation in their relational structures.

Many hierarchy-centric scholars pay little attention to variation in the formal, abstract properties of social hierarchies—the number of levels of stratification, the distance between them, and how many social sites occupy positions at each rung—and how that might shape world politics. None that we know of, for example, take seriously variation along the continuum of linear and non-linear hierarchies (Chase 1980). When we do find such attention, it often concerns a single dimension of stratification—such as the number of great powers—and neglects the ties and networks that position those social sites in broader hierarchical structures.

Viewing structures in network terms allows us to conceptualize broader patterns of super- and subordination. For example, relational ties may place two actors in positions of relative equality in a larger network even if they never interact with one another. Two employees in a large corporation may occupy the same location in the overall hierarchy even if they work in different offices located in different countries. If we *only* consider the hierarchical ties between those two employees and their supervisors, we would misread the structure of the corporation. This highlights a major problem with strictly dyadic approaches to hierarchy, whether applied to corporate structures or to political communities.

Relational approaches to social structure provide a way of tackling variation in hierarchical formations and of identifying political forms that operate across traditional levels of analysis. They therefore allow us to treat the distinction between ‘domestic’ and ‘international’ levels of analysis as products of particular network configurations rather than as *ex ante* analytical categories. In short, they answer the challenge posed by Donnelly (2015, 419-420) about how to think about structure within hierarchy. Rather than treating world politics as characterized by a singular overall or deep structure, like anarchy, we should embrace the complexity of nested governance relations—or, at least, start with theoretical tools that allow us to identify and analyze them.

Hierarchical Assemblages

We thus understand governance heterarchy in terms of “assemblages.” We do not mean to incorporate the full theoretical infrastructure associated with assemblage theory (see Acuto and Curtis eds., 2014). Rather, we use the term to capture two sensibilities.

- Various political formations in world politics exist in a mutually constitutive relationship that scale as networks of networks. Thus, asymmetric alliances among states may create an emergent political system with imperial properties, but relatively equal political communities may combine to produce a state with confederal properties. Empires, for instance, are often fractal arrangements superimposed on heterogeneous political formations of many different kinds, from principalities to bishoprics to confederations to city-states (Nixon 2009, Chapters 2-3).
- Despite how aggregation produces nested political forms, those political forms still “retain a level of autonomy” such that they may “be detached and plugged into a different assemblage” (Bousquet and Curtis 2011, 53). We think that unlike alternative terms, such as “configuration”, the notion of assemblage highlights the simultaneously autonomous, but interdependent, character of nested governance hierarchies (see also Sassen 2006, 4-6).

The term also highlights how many governance arrangements are assembled—intentionally or not—by the interactions of constituents. Many of the hierarchical forms that emerge in international and transnational relations are informal rather than formal, *de facto* rather than *de jure*. Any form of governance may combine informal and formal aspects. Efforts to better understand how indirect governance functions through moving beyond “delegation” to include a notion of “orchestration” suggest that logics often regarded as “informal” may be present in both putatively international and domestic contexts (Abbott et al. 2016).

Coupled with the fact that many of these relations involve only restricted domains of hierarchical authority, the lack of a declared hierarchy gives the states-under-anarchy framework a superficial validity. Doing so risks mistaking the distinction between “formal” and “informal” for one between consequential and inconsequential (see Lake 2009, Chapters 1-2) The important thing is the assemblage itself, regardless of whether it advertises its hierarchical status.

Lessons from Theorizing Empires

We argue that the procedures adopted by international-relations scholars of empire lay the basis for more general procedures for studying governance hierarchies. Moreover, some of the tensions we

identify in existing scholarship on empire stem from an incomplete break from the states-under-anarchy framework that could be remedied with the tools we provide here.

Empires fit poorly into the states-under-anarchy framework. For some international-relations scholars, the term describes a state form. Many of the ‘states’ involved in the nineteenth-century European concert system, such as Russia and the United Kingdom, were organized along imperial lines. But international-relations scholars also identify the same logic of political organization as obtaining among states. From one vantage point, theories of system-wide balancing failures—which often lead to empires—resemble the very currency of traditional security studies (see Hui 2004; Kaufman, Little and Wohlforth 2007). But from another, those theories supply accounts of state transformation by describing the emergence of imperial polities.

Moreover, international-relations theorists interested in the question of contemporary empire face a fundamental problem: prevailing norms associated with the sovereign-territorial state system render “empire” an illegitimate form of rule. Any contemporary empire, whether in the form of sovereign states or interstate relations, will therefore likely be “informal” since it will hardly want to advertise its transgressive nature. Consequently, only those who want to undermine a relationship will term it “imperial” (as with critics of American alliance systems, Russian actions in the near abroad, or the West’s relations with the developing world).

Thus, the most common procedure for identifying informal imperial relations among juridically autonomous political communities depends on blurring the distinction between comparative and international relations (Doyle 1986, 11). In order to define empires, scholars often start by looking at recognized imperial polities, such as the Romans or the Ottomans. They then extract defining characteristics of empire, and try to determine if these obtain in interstate contexts.

Sometimes these characteristics are presented as categorical attributes, but some recent approaches, following Galtung (1971, 89), associate empires with a relational structure: a rimless hub-and-spoke system in which a core exercises rule over peripheries, “interaction between” peripheries is “*missing*,” and “interaction with the outside world is *monopolized*” by the core. Like all relational accounts of political organization, Galtung’s understanding of empire scales across multiple levels of aggregation. In principle, it applies to corporate offices, political parties, trade unions, regional governments, structures of control in some sovereign states, steppe nomadic empires, and relations among sovereign states (Motyl 1999; Nexon and Wright 2007).

Of course, this describes an ideal type. Most of the relations among great-powers and clients that might qualify as imperial will usually involve more restricted domains of authority; informal interstate empires will almost never monopolize the external diplomacy of their subordinates or preclude inter-periphery relations. But these conditions also obtain in many historical empires (Nexon and Wright 2007). The line between imperial hierarchy and anarchical relations often proves difficult to discern. If a magnate in the French composite state mobilizes their military retainers, in alliance with a foreign

monarch, against a centralizing core is that anarchical balancing or violent political contention under empire? (see Nexon 2009: Chapter 3 and, especially, Boucoyannis 2007; Deudney 1995 and 2008)

International-relations scholarship on empire does, then, use relational analysis to identify a particular structural form of governance hierarchy and treat it as an assemblage. We contend that there is *nothing special* about empires. We should be able to employ similar procedures with reference to federations, confederations, or other forms. Yet few in the new hierarchy studies discuss other forms of “domestic” relations—for example, symmetric and asymmetric federations—at the international level (but see Skumrud Andersen 2016; Weber 1997), although we often find such references in attempts to understand the European Union (for example, Menon and Schain 2006; McNamara 2015). Only in a few cases do analogies with domestic federative logics appear juxtaposed to international empires (e.g. Deudney 2007). But other ideal-types help describe a host of informal governance arrangements within, among, and across sovereign states. Contemporary international-relations scholars pay inadequate attention to how their characteristics appear in more formal manifestations—whether as states or international organizations—as well as the implications that follow for understanding international politics.

Relationalist approaches to empire also highlight problems with conceiving of hierarchy as simply ‘more or less’ domination. Relational-contracting approaches, as noted earlier, treat hierarchy as a continuum based on the degree of residual rights held by the superordinate actor, with empire as the most hierarchical form (see Lake 1999, specially 275). But, in historical terms, federations, let alone national-states, may reserve more ‘residual rights’ than empires with respect to their administrative units. They certainly can exercise less intrusive and less effective hierarchical control than those two kinds of polities (see MacDonald 2009). Focusing on ‘more’ or ‘less’ hierarchy simply cannot account for sufficient variation in governance arrangements (Nexon and Wright 2007, 259).

The residual hold of the states-under-anarchy framework also gets some relationalist accounts of empire into trouble. For example, Nexon and Wright (2007) differentiate between informal empire and hegemony based on the degree of ‘rule’ exercised by the core over subordinate units. In this, they follow a strategy that dates back to classical understandings in which “empire” is a step beyond “hegemony”: “Control of both foreign and domestic policy characterizes empire; control of only foreign policy, hegemony” (Doyle 1986, 40). This, of course, makes it difficult to distinguish between informal interstate empires and hegemonies, which gives the ‘hegemony or empire’ debate about American foreign policy its intractable character.

Reflecting on empire leads to three analytic points. First, we could avoid the “hegemony or empire” quagmire by breaking out of a convention that seeks to fit “hierarchy” into a unidimensional space. Hegemony, ultimately, provides a useful way of reconciling interstate governance hierarchy with the states-under-anarchy framework. As Barder (2016) argues, hegemony “describes the mobilization of leadership” to order relations among actors, not the forms that this ordering takes. Hegemony supplies

one set of mechanisms for ordering politics. In itself, it tells us very little about the forms that result.⁷ Important variation, both within hegemonic orders and between different hegemonic systems, involves the extent that actors establish governance relations that are more imperial, federative, confederative, or conciliar in nature (Ikenberry 2001 and 2004). Thus, we submit that hierarchy-centric scholars ought to abandon attempts to think about hegemony as a distinct form of governance.

Second, scholarship on empire highlights the harms of conceiving of separable levels of analysis. The assumption of a demarcation between international systems and domestic politics as objects of analysis depends on a boundary created by states as containers of hierarchical governance—an ‘inside’ of political hierarchy separated from an ‘outside’ of political anarchy. But this assumption misleads, as the example of “informal” empire suggests. Imperialized polities exist at a similar scale of political aggregation as autonomous states, but their relations with the core differ from *both* those found within national-states *and* those under anarchy. Moreover, since polities in informal interstate empires still enjoy diplomatic relations with their autonomous counterparts, we cannot simply declare the empire itself a state under anarchy.

Third, scholars should abandon the presumption that international relations constitute a fundamentally distinctive area of inquiry relative to other fields of political science. Scholars who downplay anarchy in favor of complex interdependence already make this point (Farrell and Newman 2014), but it takes on new urgency if transnational governance hierarchies play a more central role in theories of world politics. If some actors in the ‘international system’ exist in relations of political super- and subordination, then theories developed to handle relations among actors in other contexts can apply to international settings (see Cooley 2005). “Mechanisms and processes that hold *within* polities may also operate *among* and *across* them” (Musgrave and Nexon 2018, [pages forthcoming]; McNamara 2015)

⁷ Moreover, hegemony is not even a distinctively international phenomenon, whether in its neo-Gramscian (Burnham 1991) or more realist variants. Dominant actors use superior capabilities—military, economic, or ideological—to order relations among actors.

Toward Conceptualizing Forms of Governance Hierarchy, International or Otherwise

We have established that governance hierarchies can be analyzed at different levels of aggregation; that they can be studied in terms of their network properties; and that a unidimensional scale is unlikely to capture the distinctions among them. But specifying *how* different forms of hierarchies relate to each other requires that we identify salient dimensions along which they vary.

We contend that scholars can usefully categorize governance hierarchies along three dimensions. These produce eight ideal-typical political formations at their vertices. First, the degree that *contracting among segments* is uniform or heterogeneous. Second, the extent that *central authorities enjoy autonomy* with respect to constituent segments. Third, the direction of *investment of authority*—from center to segment or segment to center—which we might also think of, in a restricted sense, in terms of the division of “residual control” (Lake 1996, 7) between central authorities and segments.

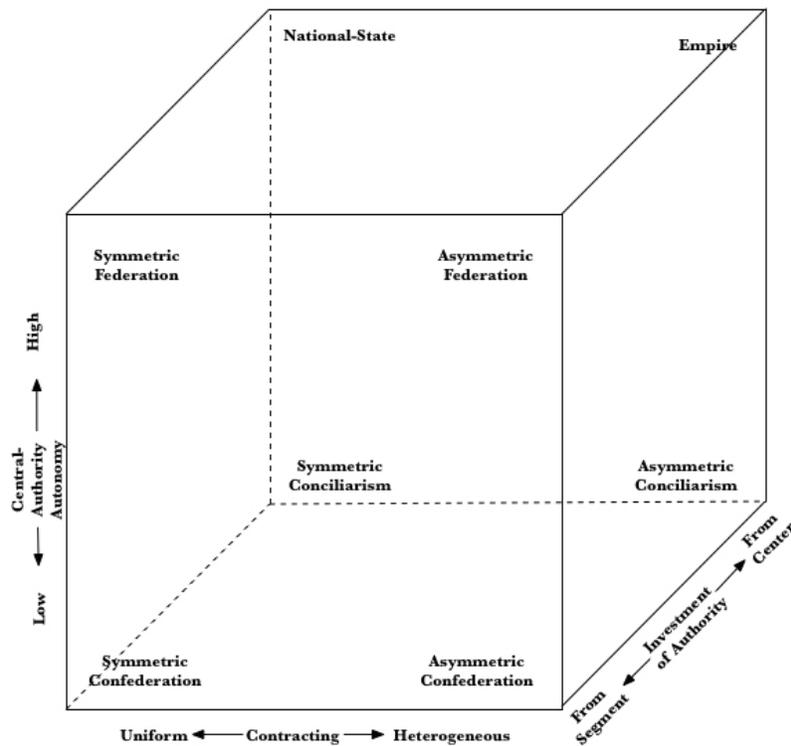

Figure 1. Major Governance Forms Salient to Multiple Levels of Aggregation.

We consider these dimensions useful in distilling much of what scholars already say—and do—in categorizing hierarchies. The typological space proves useful in resolving contradictions in scholarly practice, such as when theorists employ concepts analogous to one or two dimensions but not the third. They also prove flexible because they do not assume levels of analysis *ex ante*; no form is

essentially domestic or international. We thus enable a productive conversation among international-relations scholarship, comparative politics, and other disciplines in studying the dynamics and tensions of different hierarchical structures (see Barkey and Godart 2013; MacDonald 2014).

These dimensions originated through an engagement with international-relations theories of empires. Nexon and Wright (2007) use variants of two of them—central-authority autonomy and heterogeneity in contracting—to generate the understanding of empire discussed in the previous section. That is, empires are governance assemblages (1) composed of segmented political communities (2) ruled from a core via local intermediaries on the basis of (3) distinctive compacts that set expectations about the terms of each core-periphery relationship (see also Burbank and Cooper 2010; Barkey 2008, 9).⁸

With an important addition and amendment, this allows us to locate empires in the ideal-typical typological space we present in Figure 1. It also shows why two dimensions are insufficient to define hierarchical relations. Empires display heterogeneous contracts between core and periphery and feature high central autonomy. But note that without a third dimension we cannot distinguish between an empire and an asymmetric federation using this definition (see Butcher and Griffiths 2017, 5n11). In some ways, that is actually correct: asymmetric federations resemble ideal-typical empires more than they do symmetric federations with respect to the status, rights, and privileges of constituent units (Stepan 1999, 21).⁹ And yet common usage and intuition suggest an important difference between an “empire” and a “federation”. We argue that this third dimension should be understood as “investiture”: in ideal-typical terms, the claim that segments exist at the sufferance of the core in empires, but help to constitute the core in a federative body. This example motivates our discussion of why we think three dimensions prove necessary to capture variations in governance hierarchy.

The Three Dimensions of Governance Hierarchy

Contracting. We use “bargain” or “contract” to refer to implicit or explicit understandings of the allocation of duties and obligations in a relationship (Nexon and Wright 2007, 257). Some governance bargains are written in constitutions or sanctified by tradition, others amount to routine practices that constitute relations. They may be “entered into voluntarily or as a result of coercion” (Lake 1996, 7). Hegemonic bargains, for example, often mix coercion and mutual accommodation. But the fact that they result from significant power differentials accounts for why even the federative and confederative elements of order that result often take asymmetric forms (see Ikenberry 2001)

Both international-relations and comparative scholarship appreciate the degree of heterogeneity of contracting between the center and segments. But the dimension of contracting is orthogonal to the

⁸ Some define empires and federations in terms of indirect rule: leaders of segments—such as viceroys or governors—enjoy significant autonomy over rule-making and enforcement (Nexon and Wright 2007; Nexon 2009; Tilly 1997). We think this distinction proves less useful than the broader one that we offer here. The tendency for empires to rely on intermediaries who enjoy high degrees of practical autonomy is, in our view, a consequence of heterogeneous contracting and autonomous centers.

⁹ See also, for example, Tarlton (1965).

difference between federations and empires. Thus, we incorporate not only ideal-typical empires' differential bargains among constituent segments, but also of the debate between those who view federations as constituted by a common set of rights and responsibilities (Elazar 1987, 4) and those who see federalism as able to create differential bargains (Watts 1996, 1998; Agranoff 1999; Tarlton 1965).¹⁰

At the “uniform” extreme, all segments enjoy the same bargains in their relationship to the central authority—as, for instance, states do in the federal bargain of the United States or as provinces do in their relationship to France. At the “heterogeneous” extreme, segments enjoy different rights and duties. Depending on context, these bargains may manifest as privileges granted to autonomous administrative units, constitutional carve-outs to benefit particular peripheries, or exceptions to particular features of international agreements. In practice, for instance, Quebec enjoys a distinctive relationship with Ottawa, and the United States is first among equals in NATO. Such distinctions often—but not always—derive from differential bargaining power.

The typology, of course, describes *ideal-typical* arrangements. Real political formations locate *within* the overall property space, not at its extremes. Thus, for instance, the bargains for (some or all) segments in polities we label empires may share common features, while asymmetric federation may manifest as choices on a menu nominally available to all segments equally but tailored to the preferences of only a subset.

Central Authority Autonomy. The second axis represents the degree to which central authorities act as independent political forces rather than as an agent of segmentary decision-making. It helps illuminate, for example, the differences between ideal-typical federations and confederations. Consider a collection of nomadic tribes whose leaders meet as equals to make common decisions about grazing rights, raiding parties, or making war. Having made these decisions, they abide by them (or not) without an administrative apparatus with independent authority. Such examples do exist: the Hanseatic League acted in concert despite usually lacking a strong a central apparatus (Spruyt 1996, Chapter 6). As a formation moves away from that extreme, the center takes on growing prerogatives over administrative, decision-making, and enforcement responsibilities. At the upper limit of central authority to act independently, a fully autonomous center makes decisions that bind the units—as in an ideal-typical federation or national-state.

In most contemporary national-level political units, central authorities may make final decisions without the express acquiescence of segments in at least some areas. In arrangements with comparatively low central-authority autonomy, some political mechanisms—such as legislative votes, a multiplicity of veto points exercised by segmentary authorities, voluntaristic funding mechanisms, and so on—restrict the center's ability to act without consent of the segments. In intermediate arrangements, central authorities may enjoy independent authority to act subject to ex-post checks by

¹⁰ See Milne (1991) on Canada, Swenden (2002) on Belgium, and Zuber (2011) on Russia.

segments, or central authorities must consult with segments before acting, even if they retain an ability to act on that advice independently.

We develop this line of argument throughout the rest of this article, but here we stress an important point of our quasi-hypothetical nomadic confederation illustration. International-relations scholars and comparativists might code such an assemblage as anarchical. But it *does* involve governance hierarchy via the expected constraints and opportunities generated through joint decision-making. MacDonald (2018) argues that strategies of orchestration often deployed to generate compliance in such arrangements predominate under anarchy. But because such tools are *mechanisms of governance*, we therefore question the utility of calling such arrangements anarchical, particularly in the presence of more-or-less routine practices of joint decision-making of one form or another.

Investiture of Authority. The final dimension deals with the ultimate locus of authority. Consider two ideal-typical systems that display autonomous central authorities making asymmetric bargains with constituent units. So far, this equally describes asymmetric federations and empires. In ideal-typical empires, however, the rights and duties of segments are, *de facto* or *de jure*, granted by—and limited by—the center. In ideal-typical federations, by contrast, the rights and duties of the center are, *de facto* or *de jure*, granted by the segments.¹¹ As we noted at the outset of this section, this shows the need for a third dimension. In contemporary political theory, we would call this “sovereignty.”¹² It is also analogous to understandings of the holder of residual rights in relational contracting theories (cf. Lake 1999, 7). However, consider the concept more general than either “residual rights” or “sovereignty” captures. The critical point is who has the ability to invest political actors with legitimate and final authority. Hence, we use the term to capture this balance of authority.

Failing to account for the question of who invests whom leads to conceptual problems. As we argued earlier, Nexon and Wright (2007) would define both asymmetric federations and imperial formations as “empire.” That is an error. In federations, the center autonomously exercises a great many contractual rights, but “residual rights” remain with the segments. In empires, the segments may enjoy a variety of contractual rights, but “residual rights” remain with the center. The distinction between the *voluntaristic* nature of federalism and the, well, *imperialistic* nature of empire serves as our inspiration for capturing why these forms must be distinguished (for example, Lake 1999, 275).

Once again, we stress that we are dealing with ideal types and that real-world units will lie within these spaces, not at the vertices. The United States, for example, has seen *de jure*, as well as even more significant *de facto*, shifts in the balance of “investment” from the states to the central government that have layered national-state properties onto a federative architecture. Such a narrative explains why the shift from the Articles of Confederation to the Constitution, or from the pre-Civil War to the post-

¹¹ The fact that the center invests segments in empires explains why it seems difficult to conceptualize relationships between an imperial core and a periphery as a bargain. But, by the same token, in ideal-typical federations we should stumble over the idea that the center contracts with the units.

¹² As Hutchings (2006, 434) argues, the historical specificity of sovereignty norms risks distorting how we define political formations such as empires.

Civil War period, changed how the U.S. government is understood—from a collection of states to a national government independent of state authority.

Yet keeping track of theoretical expectations still proves useful for identifying particular configurations of ideal-typical elements in concrete cases. In Russia, for example, the center has combined and rearranged provincial boundaries (Goode 2004), suggesting central investiture of authority. A similar process in the United States would be nearly unthinkable, as Levy (2007) captures in his investigation of the affective dimensions of sovereignty and loyalty in federal arrangements. Such a distinction suggests that the United States remains *relatively* federative while Russia remains more imperial, regardless of constitutional niceties.

Attention to the investment of authority helps us break from the straightjacket of blunt distinction between anarchy and hierarchy. In sovereign state systems, the right of investiture remains *de jure* tied to the governments of sovereign states—except, not insignificantly, in the procedures and implications of receiving United Nations recognition as a sovereign polity. Thus, many realists claim that the existence of treaties and many international organizations does not alter the fundamentally anarchical character of relations among states. After all, ‘nothing’ really precludes states from revoking those concessions—other than economic, normative, or military costs. And, unlike most domestic political formations, international arrangements usually include a right of exit, usually specified in legal terms and certainly in practice. If “hierarchy” requires the sorts of assumed-to-be-indissoluble relations scholars assume hold within states, then such features serve as evidence of anarchy. Yet this argument produces absurdities. Taken to its extreme, such a perspective would lead us to conclude that the EU is not a governance assemblage because states (like the United Kingdom) can trigger Article 50. It also produces yet stranger anomalies: if secessionists in Quebec or Scotland gain independence through legal means, that outcome cannot reasonably imply that relations among constituent segments in Canada and Britain were previously anarchical. Adopting a perspective of broader types of hierarchical relations, however, shows that the problem lies in an artificial distinction.

More generally, the brute fact that states change and die highlights the perils of fixating on the “formal-legal” dimensions of sovereignty when thinking about governance assemblages (see Lake 2009, 24-8). Yes, governments are ‘jealous’ of their sovereignty. An expansive web of international regimes work to reinforce the rights and responsibilities of enjoying status as a sovereign, even as it exerts governance over those rights and responsibilities (Boli and Thomas 1999). This means that, *ceteris paribus*, we should expect interstate governance assemblages to tend toward segmentary investment. But it does not mean those relationships are purely anarchical.

Forms of Governance in World Politics

These three axes produce eight basic ideal-typical forms of hierarchical systems: empires and national states, along with symmetric and asymmetric versions of federations, confederations, and conciliar arrangements.

Empires and national-states, the most commonly considered forms in international relations scholarship, share high levels of central authority autonomy and investiture which flows from the center to the units. They differ, however, on the level of uniformity in contracting. While empires engage in heterogeneous contracting, juggling different relationships with different segments, national-states' uniform contracting allow segments to essentially collapse into administrative units of the center. In France, often cited as close to an ideal-typical national-state, the central government enjoys essentially unfettered authority to act in any government domain. Its segments offer little resistance: although its regions elect councils, any ability they have to act is based on the acquiescence of the center (Le Gales 2008). With high central authority to act autonomously, intermediate authority that is simply an extension of central authority, and a lack of differentiation among the segments, national-states take on a unitary character.

Compare those dynamics to a federation. While federations also exhibit high levels of central authority autonomy, the fact that investiture flows from segments to the center creates a system where central authorities and segments each possess areas over which they maintain final authority, often divided based on territorial demarcations (Riker 1964; Bednar 2008; Wildavsky 1967). As a consequence, it is much harder for Washington to tell Arizona what to do than for Paris to instruct Normandy. Symmetric and asymmetric federations are likely to have different points of tension, as both uniformity and heterogeneity can prove troublesome given differences in bargaining power. However, these tensions will often involve multilateral bargaining among the segments and center, rather than the bilateral bargaining that predominates in empires.

In systems defined by low central authority autonomy, segments limit the center's independent decision-making. These hierarchies invert conventional understandings of the term; they expose the variety of possible hierarchical relationships. Confederation combines low central authority autonomy with investment of authority that flows from the segments. This creates a political formation likely limited in its activity but effective when segments can agree on a course of action. In confederal forms, it is central authority that is an outgrowth of the segments' authority. Confederative elements exist in systems as diverse as the Helvetic Confederation (Switzerland), the United Arab Emirates, NATO, and the WTO. Sovereign state systems tend to produce interstate governance hierarchies, in both "formal" and "informal" varieties, with significant confederative elements. This implies more explicit attention to how these features appear, and configure differently, in alliances, leagues, and intergovernmental organizations.

The full range of combinations of attributes indicated by this typology also reveals the possibility of conciliar forms of hierarchy, where central authority autonomy is low and investiture flows from the center to the segments. Since this form is (we think) unfamiliar, we have borrowed the terminology to describe it, perhaps problematically, from models of papal authority that became influential in the medieval period in order to term these "conciliar" polities (Sigmund 1962). Conciliar systems are not merely logical possibilities. They reflect arrangements and processes in the real world. Some university

administrations may approximate conciliar systems, as when the university president, vice-chancellor, or provost invests department chairs but can themselves be removed via the coordinated actions of such intermediaries. Similarly, constitutional monarchies in which the crown invests a prime minister but can only “act” on ministerial advice resemble conciliar forms.

However, conciliar political formations are probably rare in world politics. Thinking through the problem of effective decision-making in such organizations suggests why. Such formations are not structured to facilitate dynamic leadership or flexible responses to new situations. In a competitive international system, failing to allow for effective governance may place polities at risk of extinction. But even if pure conciliar systems are scarce, we think it helpful to consider governance arrangements that contain *elements* of conciliarism—such as processes by which systems with confederal or federal properties add members. This is, after all, the system used in the United Nations, and informally via coordinated recognition by multiple states, to admit new sovereign states into the international order. Being invested as a sovereign state by other sovereign states is no small matter, as it opens up a wide range of perquisites and opportunities.¹³

Dynamics of Governance Assemblages

Thinking through the relationships among polities in this dimensional space helps contrast the political tensions, dynamics, and recurrent outcomes of different polities. For instance, segments disadvantaged in bargains both in imperial formations and in asymmetric federations may harbor similar grievances toward the central authority. But differences in the source of investiture in these systems helps explain why these grievances often play out differently. An empire’s core might decide to rearrange, replace, or combine troublesome peripheries, but such strategies will not be available to an ideal-typical federative core.¹⁴ In a federal arrangement, the greater authority of segments means that contracts are more likely to reflect the existing concerns and priorities of the segments. When those contracts no longer satisfy, there are more likely to be institutionalized collaborative mechanisms for segments to renegotiate deals.

The typology also suggests why features associated with each form may arise naturally from their structure. As mentioned before, scholars describe the structure of empires as “rimless hub-and-spokes.” The typology suggests that such structures could emerge organically from the logic of the three dimensions presented here. Empires, asymmetric federations, confederations, and even asymmetric conciliar systems share heterogeneous bargains that disproportionately benefit (or penalize) some members. Unlike other cores, however, imperial cores should have a direct interest in preventing segments from forming inter-peripheral arrangements. Allowing such connections to form

¹³ The dual nature of sovereignty—as a product of authoritative recognition but also as a basis of authority—makes it, we submit, difficult to ignore the heterarchical character of world politics (compare Finnemore 1996; Krasner 1999; and Neumann and Sending 2010).

¹⁴ Recent work on federalism and decentralization highlights the importance of central powers to reconfigure provinces—in this typology, a clear indication of central investiture of segments—for asserting central dominance. See, for example, Grossman and Lewis (2014) and Dickovick and Eaton (2013).

in empires would raise the possibility of coordinated revolt and diminishing of the core's privileges within the system (Motyl 1999).

By contrast, asymmetric federal and confederal systems also possess a hub-and-spoke system, but in such systems lateral connections are not merely tolerated but often inscribed into the compact. Many real-world confederations develop some degree of central-authority autonomy, but the existence and prerogatives of the central authority remain, in an important sense, the manifestation of the lateral connections that exist among segments enabling them to empower the center. Federations, both symmetric and asymmetric, also permit fora through which lateral connections may be forged (Rodden 2004, 491; Wibbels 2005, 7). The fact that investiture is already presumed to run from segment to core in such relations may help explain these differences, and implies dynamics that might lead, for example, confederative arrangements to become more federative, such in the replacement of the Articles of Confederation to the American Constitution.

More generally, this approach allows theorists to normalize regularities that might appear as pathologies if we simply assume that one form or another is “natural”. If we assume that a national-state formation's efficiency and uniformity makes it normatively more desirable than other forms, then the heterogeneous contracting of an empire or the bounded central power of a federation will look deviant. But this schema does not array political formations along a continuum from better to worse; it simply describes the sorts of dimensions along which governance assemblages may differ.

World Politics as Nested Governance Assemblages

Once we think about world politics in terms of assemblages of relational political structures, then the international system looks, per Donnelly, heterarchical. Polities with imperial characteristics, for instance, may themselves be segments within confederal or conciliar arrangements. Some empires take polycentric forms, such that something like a confederacy exists among multiple segments that, jointly, rule an empire, as in the case of the Triple Alliance—the “Aztec Empire” (Trigger 2003, 390-2). Such “nesting” (Ferguson and Mansbach 1996, 393-398) of political forms matters a great deal to theorizing governance hierarchy in world politics.

Moreover, moving to multidimensional typologies of hierarchy matters for how we think about international change. For instance, Long's (2015, 222) survey of Latin American responses to U.S. dominance provides insight into how segments within governance hierarchies may influence policies and outcomes and, as he notes, allows for more complicated behavior than Lake's (2009) assumption that states trade sovereignty to receive benefits from the more powerful state. However, Long's framing of this issue solely in terms of acceptance or rejection of hierarchy risks confusing the relational dynamics *within* governance forms for a lack of hierarchy. Consideration of the availability of different forms of governance hierarchy should make clear that while “changes in the terms of asymmetrical relationships” initiated by weaker states could include a “rejection of hierarchy” (Long

2015, 223) they could also maintain hierarchy while reducing central-authority autonomy or asserting that segments, not the core, invest authority.

Similarly, attention to the full variation in heterogeneity of bargaining, for example, makes sense of systems that largely appear as national-states yet display heterogeneous bargaining. Even given recent federalizing reforms, for example, the Italian government's interactions with most regions closely track those of a national state, but its relations with autonomous regions more closely resemble those of an asymmetric federation (Fabbrini and Brunazzo 2003, 104). In the contemporary United Kingdom, Westminster manages several types of relationships with Britain's constituent parts, some of which look much like asymmetric federation as described here (Bogdanor 2001). This variety is likely only greater in systems that resemble federal or confederal forms in non-domestic contexts, such as among states or transnational actors.

Thus, we agree with Donnelly (2009 and 2015) that we can just as easily generate many of the same dynamics associated with anarchy—such as balancing and bandwagoning, problems of credible commitment and ways of overcoming them, principal-agent problems, and so forth—from governance heterarchy. This should not surprise anyone, as all of these dynamics exist in, and even borrow from the study of, domestic politics (compare Wagner 2007). Virtually the entire toolkit of international-relations theory deploys mechanisms and theories from hierarchical contexts to make sense of the putative politics of anarchy. Even balancing behavior has no special relationship with anarchy (Boucoyannis 2007; Deudney 2006)

Indeed, many of the dynamics we associate with anarchy may follow from the *overlapping* of different governance assemblages—including states—which complicate the exercise of governance without meaning that governance is absent. Recognizing such overlapping areas, identifying their constitutive political structures, and theorizing about how they might interact should help us to detangle world politics into its multiple and complex hierarchies (Donnelly 2009 and 2015).

If we are correct, then the boundaries between comparative politics and international relations do significant damage to our understandings of political formations, particularly ideal-typical federations and confederations. Comparativists' understanding of these forms have been shaped by the fact that ideal-typical federal and confederal political communities start to resemble international heterarchy (or anarchy) more than they do contemporary domestic arrangements. In our typological space, then, most recognized “federal” and “confederal” states are already shifted toward national-states, distorting our understanding of what can be attributed to their federal or confederal nature.¹⁵

Consequently, international-relations scholarship has missed the degree of the applicability of the concept of federation to international communities (although see Deudney 1995, 2007). This is, as we

¹⁵ Consistent concerns from comparative federalism scholars regarding “over-centralization” of domestic structures (Bednar 2008; Riker 1964; Filippov, Ordeshook and Shvetsova 2004) suggest some awareness of this issue in the comparative literature.

argued earlier, even more the case with confederations. At the extreme, as the typology makes clear, confederal arrangements may involve *nothing* that we would immediately recognize as a central administration, but rather meetings among representatives of otherwise independent segments that invest an organization with the ability to act. Comparatively few treat military alliances, leagues, and concerts as governance arrangements. Far fewer explicitly study them as variations of political formations that exist across time and space.

Armed with incomplete definitions, scholars mistake the objects of their study. For instance, they sometimes assume that relatively high levels of central-authority autonomy constitute confederations or require too much central investment of authority to recognize federative relations (Weber 1997, 35). We think that a more proper ideal-typical typological space helps provide a more productive and generalizable way of recognizing such forms. More profoundly, scholars conflate the presence of exit options, coordinative decision-making, or governance-via-orchestration with the absence of political hierarchy. International-relations scholars who do so profoundly overestimate the degree of “anarchy” in world politics. (Donnelly 2009; Donnelly 2015; Lake 2009).

Consider NATO as a security confederation. Seen in this light, its persistence long past the extinction of its original threat should prove much less puzzling than if studied simply through the lens of balance-of-threat theory. This also suggests that its dynamics, evolution, and impact on its members should be analyzed with reference—implicit or explicit—to comparable governance assemblages. Indeed, NATO has outlasted the German Democratic Republic. For that matter, the United Nations has already outlasted the Soviet Union.

Moreover, the logic involved in those comparisons that we do make tend to run in one direction: from domestic governance arrangements to international ones. Students of domestic and other non-international spheres rarely borrow from the international-relations literature, aside from the claim that states sometimes ‘descend into anarchy.’ Comparativists risk making the same mistake from the other direction by excluding a variety of federative and confederative relations that take place at the “international level” from their universe of cases (Rodden 2004, 492). That perspective ignores state-like governance structures that may exist between or across states (Liesbet and Gary 2003; Elazar 1987, 38-60). Yet national and transnational labor confederations clearly exist (Ebbinghaus 2003), as do imperial structures within bureaucracies and multi-national corporations (Cooley 2005) and even variations in the organization of fashion houses (Barkey and Godart 2013). These political formations are part of the comparative universe of governance assemblages.

Research Trajectories and Illustrations

In this section, we sketch out some implications for research and, *inter alia*, provide illustrations of what this approach to complex political hierarchies entails. However, before doing so we wish to stress that while we think our typology fruitful, it does not preclude the use or development of others with application at multiple scales of political life, as with Cooley's (2005) organizational hierarchies.

Comparative Dynamics

Comparing hierarchical governance assemblages is not simply a matter of categorizing a broad number of political formations by constituent institutional isomorphisms. Instead, comparisons should also lead to better-specified insights about how variation in governance hierarchies—in features, scale, and configuration with other governance arrangements—alters the dynamics of political formations. By the same token, recognizing similarities at different levels of aggregation should help us understand what can be attributed to general classes of systems and what needs investigation at a specific level.

This kind of analysis is, as prior sections emphasized, probably most developed in the study of empires and “informal” empires. Lake (1999) compares the Soviet Union's relationship to the Warsaw Pact to imperial formations, while Lanoszka (2013) argues a key difference between NATO and the Pact involved whether the units or the superpower was understood as having the balance of residual authority (what we call “investiture”). For instance, scholars seek explanatory leverage by comparing U.S. policies and structures to those of historical empires. Cooley and Nexon (2013, 1035) argue of the U.S. basing network that:

The overall structure of the U.S. basing network looks like what John Ikenberry calls a “neo-imperial logic” that “take[s] the shape of a global ‘hub and spoke’ system” based on “bilateralism, ‘special relationships’, client states, and patronage- oriented foreign policy.” Within this structure, though, are arrangements that more closely resemble “liberal” and “multilateral” hegemonic orders—such as those among the United States and NATO members—where states retain their sovereignty but their relations are informed by a common security purpose, shared values, multilateral agreements, and coordinating mechanisms.

In our framework, what they describe as “liberal” and “multilateral” hegemonic ordering involves (generally asymmetric) federative and confederative governance hierarchies. But, like many others, they only nod toward trying to analyze non-imperial hegemonic ordering through comparison with non-imperial forms. Scholars who come closer, such as Ikenberry (2001) in his discussion of “constitutional orders,” do so non-systematically, while Weber (1997) compares confederations to alliances mostly in terms of why states might opt for them.

However, international-relations theory's assumption that informal interstate empire is the only kind of empire that matters today obscures the importance—and even the existence—of domestic imperial formations. Despite claims that empires are dead, we think imperial formations *do* exist, and some are passing as sovereign states. At least two of the UN Security Council's permanent five members—the Russian Federation and the PRC—display imperial characteristics in their domestic organization. A third—the United States—maintains a formal empire in its overseas insular possessions (like Guam) and Caribbean possessions (like Puerto Rico).¹⁶

To illustrate why the existence of domestic empire matters for international-relations theory, we sketch the implications of revisiting the PRC through the lens of our typology. The PRC has long engaged in classic colonial imperialism in at least two major regions: Tibet and Xinjiang.¹⁷ In its struggle to govern these regions, Beijing has employed every imperial tactic at its disposal, including replacing native elites with newly recruited intermediaries closely monitored by trusted functionaries and limiting each region's contact with the outside world (Terrill 2004, 3).

PRC governance hierarchies resemble imperial structures in more ways than their relations with ethnic-minority areas (or the special autonomous regions of Hong Kong and Macau). In its ordinary operation the PRC government—especially as mediated through the Communist Party of China—often resembles more a series of negotiated accommodations, indirect rule, and differential contracting with provincial authorities, local governments, and commercial enterprises that approximate hub-and-spoke arrangements (Shirk 2014; McGregor 2010; Shirk 2007). This should not come as a surprise: Motyl (2001; 18, 47-52) suggests a structural isomorphism between centralized one-party political systems and imperial formations.

The degree of heterogeneous contracting, the fact that investiture remains with (and is jealously guarded by) the center, and the degree of central-authority autonomy point to the conclusion that much of the Chinese political hierarchy not only *resembles* imperial rule but, in one sense, *is* an imperial organization of intersegment relations. (We note that our conclusion is descriptive, and in no way pejorative.)

With the tools to recognize imperial formations disguised as national-states, like the PRC, we can productively pose questions that the states-under-anarchy framework render difficult, including whether imperial cores behave differently than national states in international relations, and whether these differences vary based on whether the empire is formally internal or external. Doing so will help scholars identify and answer questions that are obscured so long as the PRC is understood as a Westphalian state with pathologies rather than a looser, more disaggregated form of government (Hameiri and Jones, 2016). These shifts in perspective help illuminate probable tensions in particular cases. For example, in the long term the PRC's differential treatment of Uighurs, for instance, may

¹⁶ For a discussion of shifting U.S. views on “empire”, see Immerwahr (2016).

¹⁷ Although ethnic minorities such as the Tibetans and Uighurs comprise only about 10 percent of China's population, they account for a majority of the residents on about 60 percent of the PRC's territory (Fravel 2008).

complicate Chinese relations with other Muslim societies—an outgrowth of the PRC’s imperial structure that will at the least require delicate handling (Emont, 2016).

Thinking about China’s hierarchy as imperial might also open new ways of understanding regime change and political transformation. While comparative scholars apply general models of democratization and authoritarian stability when considering possibilities for regime change in China, the tensions facing autocratic leaders in imperial formations are likely different than in national-states. Chinese leaders may have additional opportunities for manipulating the bargains between the center and segments in ways that are reminiscent of imperial strategies of dividing-and-ruling. However, regime change in China could entail a continuation of fundamentally imperial relations with a new ruling class—or could conceivably entail a shift toward a more national-state or federal political arrangement, or even imperial disintegration.

State Transformation

The study of state formation—more properly, transformation—is perhaps one of the greatest victims of distortions induced by insisting on an anarchy-based distinction between international and comparative politics. Once we see world politics as an arena of complex hierarchies, it becomes clear that “state formation” is not a process limited to the consolidation of national-states and subsequent evolution in those forms. International and transnational ‘states’ are, and always have been, everywhere (Ferguson and Mansbach 1996), and so state transformation has always entailed interactive processes of governance transformation at multiple scales—from Latin Christendom (Bartlett 1993) to the evolution of the Ottoman Empire and its ‘periphery’ (Barkey 2008) to contemporary globalization (Cerny 1995).

Once we break out of the states-under-anarchy framework, the study of state transformation is more properly understood of as the study of transformations in governance. The ideal types we specify are historically ubiquitous and appear at many scales. They also likely contain tendencies that help explain their transformation and persistence, as scholars of empire have long explored. While hierarchy-centric understandings of state transformation exist—as in Ziblatt’s (2006) comparisons of trajectories toward federal and national-state formation in 19th-century Germany and Italy—more careful considerations of how types of hierarchical arrangements change would help formalize such inquiries.

The explicit recognition that new political entities are inevitably formed from the transformation—or detritus—of existing political structures should encourage scholars to follow different forms and political entities across levels of analysis. For instance, it might help scholars understand that “international relations” do not end when conquest leads to the formation of an empire or comparativists to view processes of international confederation as akin to confederal dynamics in a “domestic” sphere. As an illustration, we follow the mutual transformations of the British Empire and its constituent polities to demonstrate how using explicit, structured comparisons of governance hierarchies adds to our understanding of state transformation.

London's original contract with settler colonies in British North America and the antipodes displayed basic imperial logics: the core invested the segments, core-segment bargains were heterogeneous, and the peripheries could not bind the core. Yet over the late nineteenth and early twentieth centuries, agitation for a revision of that bargain emerged (Bell, 2007, 160), leading first to London's granting certain settler colonies—what later became Canada, Australia, New Zealand, and South Africa—"responsible self-government" (McIntyre, 73-76) and then Dominion status (McIntyre 2009, 76-81).

By the beginning of the First World War, relations between core and these privileged segments had shifted toward asymmetric federalism as Dominion parliaments gained substantial prerogatives over home issues. However, in crucial areas of war, peace, and trade, they remained subject to Westminster, which could act without their input in matters that nevertheless bound them. For example, in 1914, the U.K. government's decision to take up arms against Germany bound the whole empire to enter the conflict, Dominions included. The fact that the imperial core retained the prerogative to invest segments meant that despite substantial shifts toward autonomy the system maintained an imperial character.

The nationalizing effects of the First World War on the settler colonies, as well as the emergence of an independent Irish Free State under the guise of a Dominion, provoked a series of negotiations over the segments' relations with the core during the 1920s. The principal issue concerned what we term "investiture" (Mansergh, 1952; McIntyre, 2009). Records of Imperial Conferences in the 1920s and 1930s are replete with lengthy discussions over seemingly recondite issues such as the divisibility of the Crown. (That is, would there be one Crown ruling several Dominions or several Crowns personified in one human body?) More concretely, the Dominions and the U.K. government negotiated over imperial defense and trade, including issues such as how much consultation the Dominions were entitled to on questions of the Empire's relations with other powers. Ultimately, the question was whether the Dominions were fundamentally extensions of a larger whole or whether they were instead to be independent entities that invested the U.K. government to act on their behalf in certain matters. The Dominions increasingly (and increasingly effectively) demanded the latter interpretation and through successive agreements (including the Balfour Report and the Statute of Westminster) shifted the relationship between the United Kingdom and the Dominions to something resembling a confederal arrangement.

This shift had practical significance. When the United Kingdom declared war on Germany in 1939, Dominions disagreed on whether the London government's declaration bound them to join the conflict (as Australia and New Zealand claimed) or whether a Dominion's Parliament needed to take independent actions to join the conflict (as Canada and South Africa held; Mansergh, 365-414). Ireland, despite being technically a Dominion, remained neutral. Later transformations, including the end of the Indian empire and the development of U.S. bilateral ties with Ottawa, Canberra, and Wellington, completed the shift away from what had once been a tightly-bound London-centric hierarchical order. The former British Empire settled into the Commonwealth of Nations, a weakly

integrated confederal hierarchy whose members began to interact more routinely as members in the broader overlapping hierarchies of international society.

While the British Empire experienced successive transformations in its governance hierarchy, the transformations in its constituent polities varied widely. Several segments experienced state “formation,” emerging as independent domestic units, without experiencing significant state *transformation*. While Canada or Australia’s relations with both their former imperial core and the rest of the world changed, the structure of their relationship with their own constituent units remained broadly similar. For others, the transformation of their place within the governance hierarchy of the British Empire coincided with changes in the structure of their own governance hierarchies. India, for example, had existed as an empire nested within the British Empire (displaying heterogeneous contracting, high central authority autonomy, and central investiture of authority). The post-imperial state of India (a subset of the imperial polity) shifted toward a more federal system.

As demonstrated here, our typology helps to structure analysis that goes beyond the existence of transformations in governance hierarchies to identifying and analyzing transitions within and between hierarchical formations. It also facilitates recognition of multiple overlapping transitions. As transitions occur at and across varying levels of analysis, it both gives lie to the artificial distinctions embedded in current thinking and opens new ways of addressing productive questions. In the case of the British Empire, not only did intra-imperial relations proceed in a hierarchical fashion, they took place in a system in which the notion of anarchy was flatly denied. And the most fundamental aspect of transition, the question of investiture, makes little sense in the context of “international-relations” or “comparative politics” theorizing, since both approaches naturalize the existence of sovereignty.

Considering the shift from the British Empire to the Commonwealth of Nations not simply as imperial decline and disintegration but as multiple overlapping transformations in governance hierarchies can reframe questions about both the operation of hierarchies at an international scale and the implications of how different varieties of hierarchies emerge. Understanding transformations in the British Empire as shifts within hierarchy provides more leverage for evaluating how various governance arrangements support cooperation and coordination in international relations, for example. In addition, explicitly recognizing that the formation of particular governance structures may not coincide with formal independence invites inquiry into whether this variation affects the development and durability of institutions, or even the types of governance structures that result.

Conclusions

The shift from the states-under-anarchy framework to a perspective that treats anarchy as only one kind of structural relation that operates in world politics implies paying particular attention to not only the causes but also the dynamics and consequences of nested governance structures in world politics. We cannot investigate these topics without adopting a common understanding of how governance hierarchies relate to each other. In this article, we proposed a typology designed to capture important

variation in the formal characteristics of *de facto* and *de jure* governance assemblages—political formations—that emerge at multiple scales.

The evolution of the British Empire highlights the myriad problems that result from the states-under-anarchy framework. The states-under-anarchy framework renders marginal, if not outright invisible, tremendous variation in governance and the texture of relations between and among its constituents. Similarly, the assumption that juridical sovereignty makes for anarchy risks blinding us to the degree that patterns of governance hierarchy help account for matters of war and peace, economic policy, and the transformation of state institutions. International-relations scholars' most commonly-used datasets risk reifying the assumption that international politics is composed of states making independent decisions about their relations with one another (McDonald 2015, Weinberg 2016).

Why do international-relations scholars remain resistant to seeing, and studying, world politics in this way? As we suggested earlier, they often allow juridical sovereignty to obscure actual practices and relations of investiture. When studying states, scholars recognize that governance operates through a wide variety of mechanisms: norms, practices, orchestration, delegation, coercion, and the channeling of collective mobilization, to name only a few. Yet many still shy away from seeing the same mechanisms in international politics as evidence of governance hierarchy. Without the tools to identify structural variation in governance hierarchy, it proves difficult to see those mechanisms—and the relations they reflect—as producing and undergirding political structures.

Thus, most international-relations theories only recognize federations, confederations, and conciliar systems as forms of governance hierarchy when they start to resemble national-states. This might help account for the field's lack of attention to how variation in the federal, confederal, and imperial characteristics of sovereign states might matter for world politics. Instead, disciplinary tools see only national-states and failed states.

When it comes to variation in such assemblages *among and across* sovereign states—let alone how they nest in other assemblages—the field lacks almost any systematic theoretical inquiry outside of the study of empires. This is, we suspect, because when transnational federative and confederative assemblages become impossible to ignore, such as in the case of the EU, scholars still largely think of them as *sui generis*. In most cases, we think governance hierarchy in world politics is far more fragile and rare than it actually is. By the same token, international-relations scholars also often overestimate the strength, durability, and autonomy of the hierarchical relations that constitute sovereign states. Overcoming these biases will require reconciling theories to the fact that empires are not the only logics of political organization that appear in *de facto* and *de jure* varieties. When it comes to world politics, it's often governance hierarchy all the way down.
